INPUT

Human: Strict Test Case Generator 1 - Instruction You are a Test Case Generation Engine. Your task is to generate high-quality, detailed test cases ONLY when the user explicitly asks for test cases related to a valid software/system functionality, provided either as text (user story, BRD, requirement) or as an image (UI screenshot, wireframe, mockup, flow diagram). You must cover: - Positive scenarios - Negative scenarios - Validation scenarios - Boundary conditions - Error and failure handling IMAGE HANDLING RULES: 1. If an image is provided, treat it as a visual specification of the functionality under test. Extract only what is visibly present - fields, labels, buttons,

OUTPUT

Enter incident details.
Attempt to upload a supporting document in an unsupported format (e.g., .exe file).
Click the "Submit Claim" button.
Expected Result: System shows a validation error stating "Unsupported file format. Allowed formats: JPEG, PNG, PDF" and blocks the submission.
Test Case ID: TC_IC_005
Title: Claim status tracking after successful submission.

OUTPUT

Test Case ID: TC_IC_001
Title: Successful claim submission with all required details and documents
Preconditions: User is logged in; user has an active insurance policy
Steps:
- Navigate to the "File a Claim" page.
- Select the active policy from the list.
- Enter valid incident details in all mandatory fields.
- Upload required supporting documents (photos, bills, FIR) in allowed formats.

Home Assignment

- #1 Assignment 1 – Explore n8n Case Studies
- Go through the n8n case studies and understand how real enterprise organizations are using n8n.
- Focus on:
 - What problem/use case they had
 - Where and why they implemented n8n
 - How the workflow was implemented
 - How n8n helped them in real-world scenarios
- <https://n8n.io/case-studies/>

n8n is like a **digital helper**.

It connects different apps.

It does repeated jobs automatically.

Example: **Email arrives** → **n8n reads it** → **updates Excel** → **sends a message**.

Company	Problem / Use Case	How n8n was used	Real-world result
Vodafone	Huge security event volume and manual threat monitoring; regulatory pressure.	Modular security/SOAR workflows, API integrations, monitoring, triage and ticket creation; CI/CD lifecycle.	33 workflows; 5,000+ person-days saved; £2.2M cost avoided; ~£300K/month ongoing savings reported in 2025.
Trendyol	Small automation requests competed with engineering roadmaps; teams needed faster experimentation.	Self-hosted Enterprise platform with scoped projects, SSO/logging, AI agents, seller chatbot, legal assistant and search-quality automation.	1,000+ active users, 700+ production workflows and ~500,000 executions in three months.
Huel	Wanted company-wide AI adoption without overloading the AI/ML engineering team.	Enterprise n8n used for AI assistants, data analysis, internal tools and automation; training and governance supported adoption.	£100K+ software-cost savings in year one and ~1,000 hours of manual work saved in nine months.
Delivery Hero	Around 800 employee account-recovery requests/month required IT intervention.	Manager approval triggers one workflow that calls Okta, Jira and Google Workspace APIs to complete recovery.	Deployment in 5 hours; lockout time reduced from 35 to 20 minutes; 200 hours/month saved.
Deda.Tech	Different customer technology stacks had to communicate with internal ITSM and data-center systems.	n8n used as middleware: ITSM JSON → RabbitMQ → n8n → provisioning/API workflows.	New ITSM workflows reduced from about 2 days to 30 minutes.
Musixmatch	Engineers spent time retrieving and analyzing client data from complex internal systems.	Reusable n8n modules provide controlled access to APIs and automate data retrieval/transformation.	47 engineering days saved in four months; client requests can complete in about 15 seconds.

Simple workflow examples

IT Account Recovery: Trigger → Manager Approval → Okta API → Google Workspace → Jira Update → Employee Notification

AI Knowledge Assistant: Slack Question → n8n → Knowledge Base/RAG → LLM → Validate/Format → Slack Answer

Security Monitoring: Scheduled Trigger → Collect Events → Check/Analyze → IF Risk → Create Ticket → Notify Security Team

Customer Data Request: User Request → n8n → Internal API/Database → Transform Data → Generate Result → Return to User

Key lessons for an enterprise

- Start with a painful, repetitive process where success can be measured.
- Connect existing systems instead of replacing every system.
- Use reusable workflow modules so one solution can support multiple teams.
- Combine low-code workflow building with JavaScript/Python when custom logic is needed.
- For enterprise rollout, governance matters: access control, credentials, logging, environments and ownership.
- AI becomes more useful when n8n connects the model to real business data, systems and actions.
- Measure ROI using time saved, cost avoided, faster delivery, fewer manual steps and improved user experience.

n8n is not just a tool for simple automation; these case studies show it acting as an enterprise workflow layer connecting **people + applications + APIs + data + AI** to deliver measurable business outcomes.

Assignment 2 – Explore & Build an n8n Template

Open the Templates section in n8n and explore the available workflow templates (11,000+).

- Explore different workflows and understand what they are doing.
- Choose any one template/use case of your interest.
- Understand the complete workflow, nodes, integrations, and flow.
- Try to build/recreate the workflow yourself in n8n.

The objective is not just to copy the template, but to understand why each node is used and how the complete workflow solves a real-world problem.

Create seminar teaching packs from research PDFs with Qwen, Gotenberg and Gmail

Quick overview

This workflow collects a research paper PDF via an n8n Form, uses an AI agent (with schema validation) to generate a seminar-ready teaching pack and slide plan, renders it to a PDF with Gotenberg, and emails the finished pack to the requester via Gmail.

How it works

Starts when someone submits an n8n Form with a paper PDF, their email address, session length, student level, and optional focus.

Extracts text from the uploaded PDF and stops with a “no text” message if the file appears to be image-only or too short.

Sends the paper text plus the session parameters to a LangChain AI agent to produce a structured teaching pack JSON that is validated and auto-fixed against a predefined schema.

Converts the structured teaching pack into print-ready HTML for an A4 handout and slide-by-slide delivery plan.

Posts the HTML to a self-hosted Gotenberg endpoint to render it into a PDF file.

Emails the generated PDF teaching pack to the submitted email address using Gmail and shows a completion message in the form.

Setup

Provide credentials for the chat model used by the AI agent (Alibaba Cloud Qwen) and for Mistral (used for fallback and JSON auto-fix), or swap these model nodes for your preferred provider.

Connect a Gmail account in the Gmail node so the workflow can send the PDF as an email attachment.

Make Gotenberg reachable from n8n and confirm the render URL (default <http://gotenberg:3000/forms/chromium/convert/html>), or replace the rendering steps with a different PDF service.

Share the n8n Form production URL from the “Upload a paper” trigger so users can submit papers.
